

Adding New Desktop Client Installers

Overview

This document covers how to add new desktop client installers to the desktop client module.

Adding installers using this method **requires Desktop Client Module version \geq 2.0.0**. To install the Desktop Client Module see [Desktop Client Module Installation](#) or for upgrading see [Desktop Client Module Upgrade](#).

1. Download the .zip archive you wish to serve:

```
wget
http://www.getisymphony.com/files/builds/isymphony/desktop_client/desktop-client-archive-2.1.3-final.6.zip
```

You can always find the latest versions of iSymphony, the Desktop Client Installers, and the Desktop Client Module at the [Download Archive](#) along with their download URLs.

2. Move the .zip archive to the installers directory created by the desktop client module:

```
mv ./desktop-client-archive-2.1.3-final.6.zip
/opt/isymphony3/server/installers/
```

3. The latest version of the desktop client will be served. If no installers are added to the installers directory then the legacy installers (version $<$ 2.0.0) will be served instead.

Removing a .zip archive will remove the hidden directory and prevent the installer from being served. Removing previous installers is not required; the latest version will always be served.

If you wish to serve the legacy installers (version $<$ 2.0.0) with the new module remove all of the .zip archives from the installer directory.
