

# Connect to Internal Database

The iSymphony internal database is an H2 instance, see: <http://www.h2database.com/html/main.html>. Do not connect to the database while iSymphony is running, concurrent connections to the database may cause corrupted data. See [Starting And Stopping The iSymphony Server](#) to stop the service.

Connecting to the database directly is not officially supported. Any issues that may arise as a result will not be covered by support; usually issues will require running the [recovery tools](#) or reinstalling iSymphony. Making a backup of the database before proceeding is highly advised.

## Connection Details:

JDBC URL: `jdbc:h2:/opt/isymphony3/server/conf/servers/default/`

user: `admin`

password: `admin`

If you have Core Servers other than `default` you will need to replace `default` with the slug of the core server you are working with.
